

Managing Mosquitoes Without Pesticides

Protect outdoor areas and yourself!

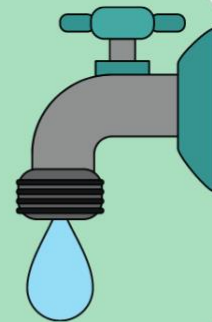

Eliminate Breeding Sites With BT

Bacillus thuringiensis (Bt) is a natural non-toxic mosquito-killing biocontrol. You can use Bt anywhere moisture or water collects (both indoors and outdoors).

"Standing water left alone keeps mosquitoes close to home."

Eliminate pooled water from leaky faucets and any places that collect water—even a bottle cap can become a breeding site.

Use Garlic-Based Sprays

Garlic Barrier and Mosquito Barrier products are more effective than pesticides and are made of non-toxic and organic materials.

Use Picaridin Instead of DEET

Picaridin, a chemical made from black pepper, is safer to use than DEET and is effective against both mosquitoes and ticks.

Use Screens, Nets, and Fans

Outdoors, consider fans to blow bugs away and place nets over strollers and baby carriers.

Use Mosquito Traps

Mosquito traps give off carbon dioxide, which mimic a breathing person or animal to attract and trap mosquitoes.
